

Tearoma App Summary

What It Is

Tearoma is a single-player terminal RPG written in C++. This repo currently implements a text-driven adventure loop with chapter-based story progression, character setup, and JSON save/load support.

Who It's For

Primary user: players who enjoy story-first, choice-driven fantasy RPGs in a command-line format, especially early adopters comfortable with an in-progress game prototype.

What It Does

- Starts a new game or continues from an existing save.
- Prompts for player setup including name, hair color, and gender.
- Runs chapter-based story scenes through timed text dialogue.
- Tracks player stats, build, rank, mana, items, abilities, summons, and party members.
- Stores story chapter, events, and path choices as progression state.
- Saves and loads progress as JSON in saves/save.json.
- Defines item, armour, weapon, consumable, NPC, and summon systems for expansion.

How It Works

- Entry loop: src/game/main.cpp seeds RNG and switches between MENU, PLAYING, and QUIT states.
- UI/input: src/game/Menu.cpp and src/systems/Dialogue.cpp print prompts, collect line input, and map numbered choices.
- Game state: Player, Story, Npc/Summon, Ability, and Item classes hold core adventure data.
- Persistence: src/engine/Save.cpp serializes player, story, and NPC state with vendored nlohmann/json.
- Data flow: launch -> menu -> create/load state -> Story::play_chapter(...) -> save_game(...) after progression.
- Services/backend: Not found in repo.

How To Run

- Requirements: g++ with C++17 support and make; additional setup docs are Not found in repo.
- From the repo root, run: make
- Start the game with: ./Tearoma
- Optional shortcut: make run
